1) Rewrite the following for loop using foreach loop

```csharp
......
string[] my_arr = {"automata", "Database systems", "Data Mining", "Adv. Visual Prog."};

for (int i = 0; i < my_arr.Length; i++)
    Console.WriteLine("I took " + my_arr[i] + " course");
```

2) Define an event member object called sth_Happened, that uses the default event arguments class (System.EventArgs).

Do not write an event handler for this, just the event object should be given.

3) Write an event handler method for a textbox object, called myTB, that shows a message box saying "I am clicked" when it is double clicked.
